Stage 1 Report May 2026

Table of Contents

1. SUMMARY	3
2. TEAM FORMATION OVERVIEW	4
3. RESEARCH AND BRAINSTORMING	5
4. IDEAS EXPLORED	6
4.1. ROUTE MANAGEMENT SYSTEM (RMS)	6
4.2. INTERACTIVE EDUCATIONAL PLATFORM	7
4.3. HYPER-LOCAL TOOL & EQUIPMENT RENTAL MARKETPLACE	8
5. IDEA EVALUATION	9
6. DECISION AND REFINEMENT	10
6.1. IDEA'S SUMMARY	10
6.2. WHY WAS IT SELECTED?	10
6.3. POTENTIAL IMPACT	11
6.4. CHALLENGES	11
6.5. OPPORTUNITIES	12

1. Summary

This report presents the outcomes of Stage 1 of the Portfolio development process. The goal of this stage was to build an effective team, conduct research and brainstorming, evaluate potential ideas, and finalize an MVP concept.

The team followed a structured approach — starting with role assignment and establishing collaboration norms, then moving into brainstorming using techniques such as Mind Mapping, scoring, and voting.

Following a thorough evaluation process, Nitaj was selected as the most suitable concept based on several key criteria's that will be mentioned.

This document covers all stages of the process: team formation, research and brainstorming, ideas explored and rejected, ideas evaluation, and a detailed overview of the chosen idea.

2. Team Formation Overview

The team relies on collaborative and teamwork-based work across all stages of the project. However, clear roles have been assigned to each member to organize the workflow and ensure effective task distribution.

In addition, the applications used are **Trello** and **Notion** for work organization and task management, while **Discord** and **WhatsApp** were used for communication and information exchange.

Team Member	Role
Haitham	Project Manager
Layla	Back-end Manager
Fai	Front-end Manager
Afnan	Development Manager

3. Research and Brainstorming

During this phase, the team focused on identifying real and existing problems within the community and exploring practical solutions that could effectively address them. The primary objective was not only to generate innovative ideas, but also to ensure that each idea had a clear social value and could contribute positively to users' daily lives. The team conducted discussions and applied structured brainstorming techniques to analyze different problem areas, evaluate their impact, and consider possible technological solutions. Special attention was given to ideas that could improve efficiency, enhance collaboration, and provide meaningful benefits to the community, ensuring that the selected direction aligns with both user needs and project feasibility.

4. Ideas Explored

4.1.Route Management System (RMS)

(RMS) is a specialized Saudi SaaS platform designed to digitize private school and workplace transport. It features real-time geospatial tracking and a unique terrain-aware algorithm to accurately calculate fuel costs and net profits for drivers. By bridging the gap between manual operations and digital intelligence, it ensures financial transparency and enhanced safety for all beneficiaries.

- Earned 290 out of 360 points, resulting in an 80.56% score.

Reason for Exclusion:

The proposed idea holds exceptional academic and practical value for a graduation project, offering a significant opportunity to solve a real-world problem while acquiring advanced technical skills in cloud computing and geospatial data. However, due to the tight academic timeline and the high technical risks involved, the team opted for an alternative project with lower complexity. This strategic decision was made to ensure high-quality delivery and mitigate potential integration setbacks within the limited timeframe.

4.2.Interactive educational platform

An interactive educational platform designed to simplify scientific concepts in mathematics, physics, geography, and chemistry by transforming them into hands-on experiments that can be built and explored by children of different age groups. The platform aims to create an engaging learning experience by connecting theory with practical, real-life applications.

- Earned 271 out 360 points, resulting in a 75.28% score.

Reason for Exclusion:

The proposed idea demonstrates strong educational and practical value, offering an innovative approach to simplifying complex scientific concepts through interactive home-based experiments. However, based on the evaluation scoring, the idea received relatively lower results compared to other proposals. The main challenges include the difficulty of designing an effective interactive user interface for the targeted age group (7–14 years), as well as the complexity of simplifying and adapting scientific concepts across different learning levels. Additionally, the requirement to develop detailed educational content for each experiment and maintain a scalable learning system exceeds the available project timeline and team capacity.

4.3.Hyper-Local Tool & Equipment Rental Marketplace

A hyper-local C2C rental marketplace that allows users to rent and share tools and equipment within a limited geographical radius. The platform focuses on creating a secure and efficient rental experience through automated digital escrow payments, local delivery services, and video-based verification during pickup and return. By reducing trust-related concerns and simplifying logistics, the system enables users to generate passive income from unused equipment while providing renters with affordable and convenient access to needed tools.

- Earned 246 out of 360 points, resulting in a 68.33% score.

Reason for Exclusion:

The team reviewed the risks and previous experiences related to similar ideas and concluded that the probability of success may be relatively low due to the existence of previous attempts that struggled to achieve sustainable growth and widespread adoption. The idea also faces a significant challenge in marketing the concept of peer-to-peer rentals to the local community and building trust between users, particularly when it comes to sharing personal tools and equipment. In addition, the platform would require a strong operational and logistical infrastructure to ensure service quality, manage deliveries, verification processes, and dispute resolution effectively, which may exceed the project scope and available development timeline.

5. Idea Evaluation

The final idea was selected through a voting process based on predefined evaluation criteria. Each team member evaluated all proposed ideas by assigning a score out of 10 for each criterion, while idea's owner was excluded from evaluating their idea to ensure fairness and objectivity. The results calculated using a weighted scoring system based on the importance of each criterion to identify the most suitable and feasible idea, with the maximum possible score being 360 points.

- The evaluation criteria and their weights were as follows:

Solving a Real Problem $\times 2$

Feasibility $\times 3$

Academic Strength of the Project $\times 2$

Innovation and Uniqueness $\times 1$

Ease of Task Distribution $\times 2$

User Experience $\times 1$

Technical Risks $\times 2$ (deducted from the total score)

Challenges and Proposed Solutions $\times 1$

This methodology helped to make a structured and objective decision while considering the team's capabilities, available timeline, and the project's future scalability potential.

6. Decision and Refinement

6.1. Summary

The selected idea was a platform designed to connect idea owners with development teams and technical collaborators, enabling structured and secure team formation. The platform provides mechanisms to protect all parties through legal agreements such as Non-Disclosure Agreements (NDAs) and partnership contracts, along with a dashboard to monitor project progress among team members.

The platform allows users to publish their ideas while preserving the confidentiality of the core concept, search for suitable collaborators, and initiate secure and organized cooperation. However, the idea focuses on delivering the essential features required for collaboration and legal protection within a simplified and scalable system.

6.2. Why was it selected?

It was selected after achieving a voting score of (294/360), equivalent to 81.7%, which was the highest result among all proposed ideas. This decision was made due to the idea's strong performance across several key aspects, including its relevance to a real-world problem, feasibility within the available time and resources, academic value, and future scalability potential. The idea also demonstrated effective task distribution among team members, a clear MVP scope, the ability to provide secure and organized user experience, and a manageable level of technical risk throughout the project timeline.

6.3.Potential Impact

The platform can contribute to simplifying the process of building teams and collaboration between ideas owners and technical specialists in a more organized and professional manner. It also helps reduce concerns related to idea theft or the lack of legal documentation by providing agreements and contracts that protect the rights of all parties involved. In addition, the platform may encourage individuals to share and develop their ideas within a secure and collaborative environment, ultimately supporting innovation and increasing opportunities for future startups and projects.

6.4.Challenges

Developing the platform presents distinct technical and operational challenges, primarily centered on delivering secure, real-time voice and video integrations without compromising system stability. A critical component of this ecosystem involves authenticating user identities through authoritative services, such as Absher, to validate contract participants and establish a high-trust environment. Furthermore, architecture must proactively address sensitive data protection and digital contract management, balancing a seamless user experience with the robust scalability required for future expansion.

6.5.Opportunities

The aim is to expand the platform into additional fields and services, as well as organizing workshops and educational sessions by inviting experts to provide valuable knowledge and guidance for platform users and beneficiaries. Moreover, it seeks to obtain partnerships and institutional support that could help projects emerging from the platform to gain easier access to incubators, accelerators, and investment opportunities. In the long term, platform has the potential to evolve into a complete ecosystem that supports innovation, entrepreneurship, and collaborative project development within a secure and organized environment.
